EXECUTIVE SUMMARY

In accordance with the Statement of Work for a Hazardous Materials Survey & Lead Paint Risk Assessment for the Fritz Peak Observatory located in Rollinsville, Colorado issued by the National Oceanic & Atmospheric Administration (NOAA) Office of Oceanic and Atmospheric Research (OAR) under BPA No. ST-1330-17-BA-0075, and EA Engineering, Science, and Technology, Inc. PBC (EA) proposal number 0702347, EA was contracted by NOAA to conduct a hazardous materials survey of three buildings and perform a lead paint risk assessment for one building located at the Fritz Peak Observatory in Rollinsville, Colorado. NOAA is in the process of relinquishing ownership of the buildings. The three structures are located on a portion of an approximately 5.33-acres of land owned by NOAA that borders Colorado Highway 119, approximately 1.8 miles south of Rollinsville, Colorado. Inspection and assessment services consisted of inspection and sampling of suspect asbestos-containing materials (ACM) to determine asbestos content; inspection and testing of paint surfaces to locate, quantify, and assess risk for the presence of lead-based paint (LBP); inspecting light fixtures, ballasts, and other electrical equipment to assess the presence of polychlorinated biphenyls (PCBs) and mercury; and recording the presence of environmentally regulated substances. EA subcontractor American Veterans Environmental LLC (AVENV) inspectors Sam Rolf, Paula Bowers, and John Burnside, along with EA inspector Ben Powell conducted the inspections on 23 and 24 September 2019.

Asbestos-containing Materials Survey

Laboratory Building

AVENV identified nine homogeneous areas of suspect ACM that contained regulated levels of asbestos [greater than 1 percent, as defined by the United States Environmental Protection Agency (EPA)]. Seven of these materials were non-friable and two were friable. All were in good condition at the time of the inspection:

- CK03: Grey caulking associated with wood frame of door (3% Chrysotile)
- FDM01: Metal fire doors (assumed)
- FTM02: 9-in. x 9-in. rose, gray, and green floor tiles with black mastic (2% Chrysotile)
- FTM03: 9-in. x 9-in. brown floor tiles with black mastic (2% Chrysotile)
- OT01: Green chalkboards (assumed)
- RF01: Black and silver roof flashing (5% & 10% Chrysotile)
- RT01: Tar and gravel roofing material (5% Chrysotile)
- TS01: Skim texture-trowel pattern on drywall, painted (3% Chrysotile)
- TS02: Skim texture-heavy trowel pattern on drywall, painted (3% Chrysotile)

Cottage

AVENV identified one homogeneous area of suspect ACM that contained regulated levels of asbestos. This material was friable and in good condition at the time of the inspection:

- TS03: Heavy orange peel texture on drywall (2% Chrysotile)

Observation Platform Shed

AVENV identified two homogeneous areas of suspect ACM that are assumed to contain regulated levels of asbestos. These materials were non-friable and were in good condition at the time of the inspection:

- CB01: Cement board – transite panels (assumed)
- RSG02: Green and black asphalt composition shingle (assumed)

Lead-Based Paint Inspection

Laboratory Building

X-ray Fluorescence (XRF) results indicated the presence of one component (building element, substrate, and paint color combination) from one lead-based paint (paint surface coatings whose lead content is equal to or greater than 1.0 mg/cm^2) coating was identified. These results are presented in Table 4 (Section 3.0 – Results). An additional two-hundred and twenty-six surfaces were identified as lead containing paint (LCP), defined as paint content greater than 0.0 mg/cm^2, and less than 1.0 mg/cm^2.

Cottage

XRF results indicated the presence of one component from which four lead-based paint coatings were identified. These results are presented in Table 5 (Section 3.0 – Results). An additional twenty surfaces were identified as LCP.

Observation Platform Shed

XRF results indicated the presence of seven components from which twelve lead-based paint coatings were identified. These results are presented in Table 6 (Section 3.0 – Results). An additional twenty-five surfaces were identified as LCP.

Lead-Based Paint Risk Assessment

Cottage

Visual inspection did not indicate the presence of damaged (cracking, peeling, or chipping) and/or deteriorated (chalking) paint and XRF testing did not indicate the presence of LBP.

Each of the seven dust wipe samples were below the HUD acceptable lead-dust level. As such, dust does not present a lead hazard at this time.

Polychlorinated Biphenyls (PCBs)

Laboratory Building

Approximately one-hundred and eighteen fluorescent light ballasts are assumed to contain PCBs, as indicated by age and lack of "No PCBs" labeling. EA did not observe any transformers or other building equipment/components labelled or assumed to contain PCBs during the inspection.

Cottage

EA did not identify light ballasts or other building equipment/components labelled or assumed to contain PCBs during the inspection of the Cottage.

Observation Platform Shed

Approximately nine fluorescent light ballasts are assumed to contain PCBs, as indicated by age and lack of "No PCBs" labeling. EA did not observe any transformers or other building equipment/components labelled or assumed to contain PCBs during the inspection.

Mercury-Containing Sources and Other Environmentally Regulated Materials

Mercury is assumed to be present in the fluorescent light tubes (FLT) identified throughout the buildings.

Laboratory Building

Approximately 424 4-ft. FLTs, nine 2-ft. FLTs, four 18-in. FLTs, four 14-in. FLTs, five 12-in. circle FLTs, four 6-in circle FLTs, and six mercury ampules located in thermostats were identified in the Laboratory Building. There were also 30 smoke detectors, six "EXIT" signs, 12 ABC-type fire extinguishers, two 8-BC-type fire extinguishers, one Oasis water cooler, one Kelvinator refrigerator, five carrier condensers, two through-wall AC units, one approximately 1,000-gal. propane tank, and numerous chemicals stored in the four storage locations described in Section 3.0 Results. No leaking refrigerant was observed during the time of the inspection.

Cottage

Approximately 12 FLTs, one smoke detector, and two paint cans were identified throughout the building.

Observation Platform Shed

Approximately 18 FLTs, two smoke detectors, one ABC-type fire extinguisher, one 1-pt. Minwax wood hardener, four 1-pt. DAP wallboard joint compound, one leaking 6-cell battery, sixteen (16) 1-gal. paint cans, one 1-gal. assumed paint thinner, and two 10.1-oz. silicone sealant were identified throughout the building. Four compressed gas cylinders labeled as containing carbon dioxide (CO2), which were likely empty, located in a closet attached to the building's east exterior wall were also identified.

1.0 INTRODUCTION

In accordance with the Statement of Work for a Hazardous Materials Survey & Lead Paint Risk Assessment for the Fritz Peak Observatory (issued under BPA No. ST-1330-17-BA-0075), and EA Engineering, Science, and Technology, Inc. PBC (EA) proposal number 0702347, EA was contracted by the National Oceanic Atmospheric Administration (NOAA) Office of Oceanic and Atmospheric Research (OAR) to perform a hazardous materials survey of three buildings and a lead risk assessment for one building located at the Fritz Peak Observatory in Rollinsville, Colorado. NOAA is in the process of relinquishing ownership. The three structures are located on a portion of an approximately 5.33-acres of land owned by NOAA that borders Colorado Highway 119 approximately1.8 miles south of Rollinsville, Colorado. Inspection and assessment services consisted of inspection and sampling of suspect asbestos-containing materials (ACM) to determine asbestos content; inspection and testing of paint surfaces to locate and quantify lead-based paint (LBP); inspecting light fixtures, ballasts, and other electrical equipment to assess the presence of polychlorinated biphenyls (PCBs) and mercury; and recording the presence of environmentally regulated substances. Current Federal and State environmental regulations require that certain potentially hazardous materials that may be affected by structure alteration activities (demolition, renovation, maintenance, mechanical upgrades, etc.) be identified and removed prior to conducting these activities.

In the case of asbestos, Environmental Protection Agency (EPA) and Occupational Safety and Health Administration (OSHA) asbestos regulations (40 CFR 61 and 29 CFR 1926.1101, respectively) require that ACM be identified, and that friable ACM, and ACM that has the potential to become friable, be removed prior to conducting alteration (renovation, demolition, maintenance, facility/equipment upgrades, etc.) activities that may disturb these materials. Local EA hazardous materials subcontractor AVENV conducted the asbestos inspection in accordance with Asbestos Hazard Emergency Response Act (AHERA) inspection and sampling protocols to determine the presence of asbestos in building materials throughout the buildings.

Requirements for the identification and notification of the presence of lead-based paint (LBP) and lead-containing paint (LCP) are found in 29 CFR 1926.62. Although LBP/LCP removal is not required prior to structure or building component alteration, contractors working in areas where LBP/LCP is present must be notified of its location and must take appropriate action to minimize its disturbance and protect workers and the environment. In many cases, removal of leaded paint presents the only viable option to limiting exposure. Lead-containing waste must also be sampled to determine appropriate disposal requirements. AVENV conducted XRF sampling of painted components throughout each building to determine lead content of the paint. This inspection was performed in accordance with Chapter 7: Lead-Based Paint Inspection of the U.S. Department of Housing and Urban Development (HUD), Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing (Second Edition, August 2012).

According to the EPA, fluorescent light ballasts (FLB) manufactured prior to August 1978 have a greater than 50% chance of containing PCBs at a minimum of 50 parts per million (ppm). PCB use in light ballasts was banned after August 1978, and the EPA required that “No PCBs” labels be affixed to ballasts manufactured after August 1978 through 1998. If a ballast is manufactured after 1998, the EPA no longer requires a “No PCBs” label as proof that the ballast does not contain PCB’s. Based on these guidelines, ballasts manufactured prior to 1999 that are either unlabeled or do not bear “No PCBs” labeling should be assumed to contain PCBs at levels greater than 50 ppm [in accordance with requirements of 40 CFR 761(b)]. PCB-containing equipment whose PCB content is 50 ppm or greater is regulated for disposal purposes.

Mercury-containing light tubes and bulbs whose mercury content is 0.2 milligrams per liter (mg/L) mercury or greater are regulated for disposal in accordance with 40 CFR 261–263. Fluorescent tube manufacturers indicate that all fluorescent tubes contain some amount of mercury, as do typical high-intensity discharge (HID) bulbs. Other mercury-containing components, such as liquid mercury ampules contained in thermometers and thermostats should also be handled in accordance with 40 CFR 261-263. Packaging, transport, and disposal of the mercury-containing sources should be conducted in accordance with 40 CFR part 273 standards for universal waste management. EA's inspection included preparing an inventory of suspected mercury-containing items, including light tubes/bulbs and mercury ampules, for each building.

Other regulated hazardous materials, such as containerized hazardous substances and batteries, should be treated as universal waste and disposed of in accordance with 40 CFR 261, 266, and 279, respectively. Reclamation and/or recycling and re-use of ozone-depleting refrigerants and other chlorofluorocarbon (CFC)-containing substances should be conducted in accordance with 40 CFR Part 82, Subpart F. Disposal of any other hazardous products should be conducted in accordance with label instructions and any applicable federal and state regulations in order to prevent a release.
.

2.0 METHODOLOGY

Asbestos-Containing Materials Survey

The asbestos inspection was conducted in accordance with EPA Standard 40 Code of Federal Regulations (CFR) 763 Asbestos Hazard Emergency Response Act (AHERA), Subpart E, as well as AHERA inspection and sampling protocol, and included identifying homogeneous areas of suspect ACM, determining suspect ACM friability, assessing homogeneous areas of suspect ACM, and collecting samples of suspect ACM to determine asbestos content. The asbestos inspection was an investigation performed to identify suspect ACM and included the interior and exterior of each building.

Samples of suspect ACM were submitted to Eurofins CEI for analysis by Polarized Light Microscopy (PLM) in accordance with the EPA Method for the Determination of Asbestos in Bulk Insulation Samples (EPA/600/R-93/116). Analytical procedures included positive stop methodology, whereby a sample set representing a homogeneous area of suspect ACM is analyzed until a result indicating >1% asbestos is obtained. Once such result is obtained, any additional samples in the set are not analyzed and the homogeneous area is considered to be asbestos-containing. If no results indicating >1% asbestos are obtained, the homogeneous area is considered to be non-asbestos. Eurofins CEI is certified for bulk asbestos sample analysis via PLM by the National Institute for Science and Technology (NIST) National Voluntary Laboratory Accreditation Program (NVLAP). Please refer to Appendix A for AVENV Report containing laboratory certifications.

Lead-Based Paint Inspection

AVENA conducted a lead-based paint HUD inspection of accessible painted surfaces, including those on the interior and exterior of the three buildings and other structures and appurtenances. The inspection was designed to identify building/structure elements (walls, doors and door components, structural support framework, window components, etc.) with surface coatings that contain lead. The survey consisted of testing for lead concentrations of painted surfaces utilizing a Niton Xlp-300 X-Ray Fluorescence (XRF) spectrum analyzer.

At this time, there are no federal or state regulations that specifically identify testing procedures for non-residential structures scheduled for alteration. AVENV conducted the survey and inspection in accordance with HUD and followed the XRF manufacturer's testing methodology during the survey. Prior to obtaining readings from suspect LBP surfaces, the XRF was calibrated in accordance with the manufacturer's instructions. Calibration checks were performed prior to and at the completion of the inspection.

The side of the room was determined by the address side wall of the building. Under the heading "Side" the listing would refer to the side wall of the building in the front with the sides B, C, and D designations referring to the remaining walls in a clockwise rotation.

Surfaces were identified as LBP if the result met the HUD and Colorado's State definition of lead-based paint [$\geq$1.0 mg/cm^2 (milligrams per square centimeter)]. Any XRF readings above 0.0 mg/cm^2, but less than or equal to 1.0 mg/cm^2 are identified as lead-containing paint (LCP).

Lead-Based Paint Risk Assessment

AVENV conducted a lead-based paint risk assessment in accordance with the requirements of HUD Chapter 5, *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing (Second Edition, August 2012*). The risk assessment included a visual review of paint condition, and dust sampling and analysis. Painted surfaces are described as the following;

- Intact: no peeling paint on the component; entire surface is intact.
- Fair: less than or equal to two square feet of damaged paint.
- Poor: more than two square feet of damaged paint.

Dust wipe samples were collected in accordance with HUD Chapter 5, Section IIB – Dust Sampling, and Appendix 13.1 (Wipe Sampling for Settled Lead-Contaminated Dust) of the HUD Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing. Analysis of the wipe samples were conducted per the American Society for Testing and Materials (ASTM) Standard ES 30-94.

Polychlorinated Biphenyls (PCBs)

EA conducted an inspection to identify accessible PCB-containing equipment such as light ballasts, transformers, hydraulic fluid reservoirs, etc. Light ballasts within accessible light fixtures were inspected throughout each building. According to the EPA, fluorescent light ballasts manufactured prior to August 1978 have a greater than 50% chance of containing PCBs at 50 parts per million (ppm) or higher. PCB use in light ballasts was banned after August 1978, and the EPA required that "No PCBs" labels be affixed to ballasts manufactured after August 1978 through 1998. If a ballast is manufactured after 1998, the EPA no longer requires a "No PCBs" label as proof that the ballast does not contain PCB's. Based on these guidelines, ballasts manufactured prior to 1999 that are either unlabeled or do not bear "No PCBs" labeling should be assumed to contain PCBs at levels greater than 50 ppm [in accordance with requirements of 40 CFR 761(b)]. PCB-containing equipment whose PCB content is 50 ppm or greater is regulated for disposal purposes.

Mercury-Containing Sources and Other Environmentally Regulated Materials

EA visually inspected accessible light fixtures to determine if they contained tubes or bulbs that may contain mercury. Fluorescent tube manufacturers indicate that all fluorescent tubes contain some amount of mercury, as do typical high-intensity discharge (HID) bulbs. Mercury-containing light tubes and bulbs whose mercury content is 0.2 milligrams per liter (mg/L) mercury or greater are regulated for disposal purposes. EA also inspected thermostats and thermometers to observe for mercury components, such as liquid mercury ampules. Visual observations were also made for other mercury-containing equipment.

EA also conducted a visual inspection to identify the type and location of environmentally regulated materials. The inventory of identified materials included the type of material identified (determined by container labeling), the approximate quantity of the substance (based on container size), and the location and condition of the containers.

3.0 RESULTS

Asbestos-Containing Materials Survey

Laboratory Building

AVENV collected 61 bulk samples from 30 homogeneous areas of suspect ACM identified at the Laboratory Building. Seven of the homogeneous areas of suspect ACM contained regulated levels of asbestos. Two of the homogeneous areas are assumed to contain regulated levels of asbestos. Seven of the homogeneous areas of ACM were non-friable and in good condition at the time of the inspection, and two of the homogeneous areas of ACM were friable and in good condition at the time of the inspection.

Table 1 below contains a summary of confirmed and assumed ACM. Physical sample locations, analytical certificates of analysis, Suspect ACM Homogenous Area Summary, and chain-of-custody forms are included in the report from AVENV found in Appendix A.

TABLE 1: LABORATORY-CONFIRMED ACM AT THE OBSERVATION LABORATORY

Homogenous Area	Material Description	Material Location	Quantity	Condition	Friability	Result
CK03	Gray caulking associated with wood frame of door	Exterior of building	1 SF	Good	Non-friable	3% Chrysotile
FDM01	Fire door material	First floor	3 EA	Good	Non-friable	Assumed
FTM02	9-in. x 9-in. floor tile with black mastic, 3 colors-rose, gray, and green	Second floor	2,386 SF	Good	Non-friable	2% Chrysotile
FTM03	9-in. x 9-in. floor tile with black mastic	Second floor room 2208; kitchen	636 SF	Good	Non-friable	2% Chrysotile
OT01	Green chalkboards	First floor, second floor hall, third floor office	3 EA	Good	Non-friable	Assumed
RF01	Roof flashing black and silver	Exterior roof perimeter and on roof access hatch	1,000 SF	Good	Non-friable	5% & 10% Chrysotile
RT01	Tar and gravel roofing material	Exterior roof of building	3,586 SF	Good	Non-friable	5% Chrysotile
TS01	Skim texture-trowel pattern on drywall, painted	Second floor ceilings – room 2202 and adjoining hallway	1,050 SF	Good	Friable	3% Chrysotile
TS02	Skim texture-heavy trowel pattern on drywall, painted	Second floor ceilings – room 2101	1,000 SF	Good	Friable	3% Chrysotile

LF – Linear Feet
SF – Square Feet
EA – Each

Observation Cottage

AVENV collected 13 bulk samples from five homogeneous areas of suspect ACM identified at the Cottage. One of the homogeneous areas of suspect ACM contained regulated levels of asbestos. This homogeneous area of ACM was friable and in good condition at the time of the inspection.

Table 2 below contains a summary of confirmed ACM. Physical sample locations, analytical certificates of analysis, Suspect ACM Homogenous Area Summary, and chain-of-custody forms are included in the report from AVENV found in Appendix A

TABLE 2: LABORATORY-CONFIRMED ACM AT THE COTTAGE

Homogenous Area	Material Description	Material Location	Quantity	Condition	Friability	Result
TS03	Heavy orange peel texture on drywall	Interior walls and ceilings	1,000 SF	Good	Friable	2% Chrysotile

SF – Square Feet

Observation Platform Shed

EA collected eight bulk samples from six homogeneous areas of suspect ACM identified at the Observation Platform Shed. None of the homogeneous areas of suspect ACM contained regulated levels of asbestos. However, two homogeneous areas were assumed to contain asbestos. These materials were non-friable and in good condition at the time of the inspection.

Table 3 below contains a summary of ACM at the Observation Platform Shed. Physical sample locations, analytical certificates of analysis, Suspect ACM Homogenous Area Summary, and chain-of-custody forms are included in the report from AVENV found in Appendix A

TABLE 3: LABORATORY-CONFIRMED ACM AT OBSERVATION PLATFORM SHED

Homogenous Area	Material Description	Material Location	Quantity	Condition	Friability	Result
CB01	Cement Board - Transite Panels	Interior, behind wall mounted electric heaters	4 EA	Good	Non-friable	Assumed
RSG02	Green and Black, Asphalt Composition Shingle	Exterior, roof of storage shed	5 SF	Good	Non-friable	Assumed

EA – Each
SF – Square Feet

Lead-Based Paint Inspection

Laboratory Building

XRF results indicate the presence of one component from which one lead-based paint coating was identified. A component is defined as a unique combination of building element, substrate, and color. The concentration of the LBP associated with that surface was 1.3 mg/cm^2. A total of 226 surfaces were identified as LCP with lead concentrations ranging from 0.01 to 0.40 mg/cm^2. Appendix A contains the report from AVENV that includes the comprehensive XRF test results. Room locations referenced and physical sample locations are also provided in Appendix A. Table 4 below presents a listing of building components and associated paint coatings identified as LBP.

TABLE 4: PAINTED SURFACES IDENTIFIED AS LBP AT THE OBSERVATION LABORATORY

Room	Floor	Building Component	Substrate	Color	Side	Condition	Result (mg/cm^2)
Exterior	First	Ceiling	Wood	Grey	C	Poor	1.3

mg/cm^2 – milligram per square centimeter
Intact – No peeling paint on the component, entire surface is intact
Fair – Small amount of surface damage, although still intact.
Poor – Surface is not intact, greater than 2 square feet peeling or damaged.

Cottage

XRF results indicate the presence of one component from which four lead-based paint coatings were identified. A component is defined as a unique combination of building element, substrate, and color. The concentrations of the LBP associated with those surfaces were 3.2 mg/cm^2 to 4.5 mg/cm^2. A total of 20 surfaces were also identified as LCP with lead concentrations ranging from 0.01 to 0.70 mg/cm^2. Appendix A contains the report from AVENV that includes the comprehensive XRF test results. Room locations referenced and physical sample locations are also provided in Appendix A. Table 5 below presents a listing of building components and associated paint coatings identified as LBP.

TABLE 5: PAINTED SURFACES IDENTIFIED AS LBP AT THE COTTAGE

Room	Floor	Building Component	Substrate	Color	Side	Condition	Result (mg/cm^2)
Exterior	First	Wall	Wood	Grey	A	Intact	4.4
Exterior	First	Wall	Wood	Grey	B	Intact	3.2
Exterior	First	Wall	Wood	Grey	C	Intact	3.4
Exterior	First	Wall	Wood	Grey	D	Intact	4.5

mg/cm^2 – milligram per square centimeter
Intact – No peeling paint on the component, entire surface is intact
Fair – Small amount of surface damage, although still intact.
Poor – Surface is not intact, great than 2 square feet peeling or damaged.

Observatory Platform Shed

XRF results indicated the presence of seven components from which 12 lead-based paint coatings were identified. A component is defined as a unique combination of building element, substrate, and color. The concentrations of the LBP associated with those surfaces were 1.1 mg/cm^2 to 1.7 mg/cm^2. A total of 25 surfaces were also identified as LCP with lead concentrations ranging from 0.01 to 0.90 mg/cm^2. Appendix A contains the report from AVENV that includes the comprehensive XRF test results. Room locations referenced and physical sample locations are also provided in Appendix A. Table 6 below presents a listing of building components and associated paint coatings identified as LBP.

TABLE 6: PAINTED SURFACES IDENTIFIED AS LBP AT THE OBSERVATORY PLATFORM SHED

Room	Floor	Building Component	Substrate	Color	Side	Condition	Result (mg/cm^2)
Exterior	First	Wall	Metal	Green	D	Fair	1.7
Exterior	First	Window Sash	Metal	Green	C	Fair	1.5
Exterior	First	Door	Metal	Green	A	Fair	1.4
Exterior	First	Window Sash	Metal	Green	A	Fair	1.4
Exterior	First	Wall	Metal	Green	A	Fair	1.3
Exterior	First	Wall	Metal	Green	B	Fair	1.2
Room 01	First	Floor	Wood	Grey	D	Intact	1.5
Room 02	First	Floor	Wood	Grey	A	Intact	1.1
Shed Exterior	First	Door	Wood	Green	C	Poor	1.3
Outhouse Exterior	First	Soffit	Wood	Green	A	Poor	1.3
Outhouse Exterior	First	Wall	Wood	Green	D	Poor	1.2
Outhouse Exterior	First	Soffit	Wood	Green	D	Poor	1.4

mg/cm^2 – milligram per square centimeter
Intact – No peeling paint on the component, entire surface is intact
Fair – Small amount of surface damage, although still intact.
Poor – Surface is not intact, great than 2 square feet peeling or damaged.

Lead-Based Paint Risk Assessment

Cottage

Visual inspection did not indicate the presence of damaged (cracking, peeling, or chipping) and/or deteriorated (chalking) paint. However, LBP inspection determined four testing combinations on the exterior did contain LBP.

Seven lead dust samples were collected from interior areas of the Cottage, including a blank sample for quality control. None of the dust wipe samples were above the HUD lead dust clearance level (40 µg/sq. ft. for floors, 250 µg/sq. ft. for windowsills, and 400 µg/sq. ft. for window troughs). Dust wipe results are listed below.

- Room 01 Living room, Floor – 13 µg/sq. ft.

- Room 01 Living Room, Windowsill – 13 µg/sq. ft.
- Room 02 Bedroom, Floor – 12 µg/sq. ft.
- Room 02 Bedroom, Windowsill – <15 µg/sq. ft.
- Room 03 Bedroom, Floor – 11 µg/sq. ft.
- Room 03 Bedroom, Windowsill – <15 µg/sq. ft.
- Blank – <10 µg/sq. ft.

Analytical certificates of analysis and chain-of-custody forms are included in AVENV Report found in Appendix A.

Polychlorinated Biphenyls

Laboratory Building

Approximately 118 fluorescent light ballasts are assumed to contain PCBs, as indicated by age and lack of "No PCBs" labeling. EA did not observe any transformers or other building equipment/components labelled or assumed to contain PCBs during the inspection. Other ballasts contained in fluorescent light fixtures were labelled "No PCBs".

Cottage

EA did not identify light ballasts or other building equipment/components labelled or assumed to contain PCBs during the inspection of the Cottage.

Observation Platform Shed

Approximately nine fluorescent light ballasts are assumed to contain PCBs, as indicated by age and lack of "No PCBs" labeling. EA did not observe any transformers or other building equipment/components labelled or assumed to contain PCBs during the inspection. Other ballasts contained in fluorescent light fixtures were labelled "No PCBs".

Mercury-Containing Sources and Other Environmentally Regulated Materials

Laboratory Building

Approximately 424 4-ft. FLTs, nine 2-ft. FLTs, four 18-in. FLTs, four 14-in. FLTs, five 12-in. circle FLTs, four 6-in. circle FLTs, six mercury ampules located in a thermostats, 30 smoke detectors, six "EXIT" signs, 12 ABC-type fire extinguishers, two 8-BC-type fire extinguishers, one Oasis water cooler, one Kelvinator refrigerator, five carrier condensers, two through-wall air-conditioning units, one approximately 1,000-gal. propane tank, and four locations with the following;

- Third Floor Cleaning Closet – one 1.66-L. ammonia cleaner, one 1-gal. paint, one 1.25-qt. Liquid Plumber, one 8-oz. Loctite rust resolver, and one 21-oz. scouring powder.
- Second Floor Cabinet – three 1-qt. Windex, two 1.3-qt. Ultra Palmolive Original, one 1-pt. Lime A-way, one 2-pt. Lime A-way, two 24-floz. Simple Green, one 40-oz. window cleaner, one 2-qt. all-purpose cleaner with ammonia, one 1-qt. 409 all-purpose cleaner, one 12-fl. oz. Goo-Gone Spray Gel, one 1-qt. Quik Fill 910, one 1-gal. Quik Fill 910, one 8-oz. Energine Spot Remover, one 8-oz. Silvo Metal Polish, one 8.5-fl. oz. Kleen Logik Freezer Frost Remover, one 1-gal. pink lotion hand cleaner silk, one 1-gal. home-brew widow cleaner, two 18-oz. Mipty Dust Mop

Treatment, one 8-oz. Ortho Malathion 50 Insect Spray, one 8-oz. polyurethane polish, one 16-oz. Scott's Liquid Gold, one 1-pt. Black Flag Roach and Ant Killer, one 19-oz. Terro Ant Killer, one 15-oz Raid Wasp and Hornet Killer, two 8-oz. WD-40.

- Second Floor Kitchen – one 1-qt. Windex, one 1.3-qt. Palmolive Ultra Original, two 10-oz cans of scouring powder, and one 1-qt. Lux dishwashing liquid.
- First Floor Flame Cabinet – one 5-gal. can of ethyl alcohol-200 proof dehydrated alcohol, one 4-L jug of methyl alcohol anhydrous, one approximate 2-L ethanol, one 20-L can of methanol, one approximate 2-L isopropyl, one jug of used oil, one propane torch, one jug un-labeled substance, one 1-gal jug of thread cutting oil, one 1-gal can of multi-purpose lubricant, one 12-oz. can of fuel system antifreeze.

Cottage

Approximately 12 4-ft. FLTs, one smoke detector, and two 1-gal. cans of latex paint were identified throughout the cottage.

Observation Platform Shed

Approximately 18 4-ft. FLTs, two smoke detectors, one ABC-type fire extinguisher, one 1-pt. Minwax wood hardener, four 1-pt. DAP wallboard joint compound, one leaking 6-cell battery, 16 1-gal. paint cans, one 1-gal. assumed paint thinner, and two 10.1-oz. silicone sealant were identified throughout the building. EA also identified four compressed gas cylinders labeled as containing carbon dioxide (CO2), which are likely empty, located in a closet attached to the building's east exterior wall.

4.0 CONCLUSIONS AND RECOMMENDATIONS

Asbestos Containing Materials Survey

Laboratory Building

Seven of the homogeneous areas of asbestos-containing materials identified at the building (presented in Table 1 in Section 3.0 Results) were observed to be non-friable and in good condition. Two homogeneous areas of asbestos-containing materials identified at the building were observed to be friable and in good condition. These materials should be removed if the building is to be demolished or if these materials are to be disturbed during building renovation activities. Proper federal and state regulations governing pre-alteration ACM removal must be followed. Removal of ACM must be conducted by properly licensed and accredited individuals working for a licensed asbestos abatement contractor.

Should any new materials be found during renovation or demolition they should be assumed to contain asbestos until sampled and proven to be non-asbestos.

Cottage

Asbestos-containing materials identified at the building (presented in Table 2 in Section 3.0 Results) were observed to be friable and in good condition. These materials should be removed if the building is to be demolished or if these materials are to be disturbed during building renovation activities. Proper federal and state regulations governing pre-alteration ACM removal must be followed. Removal of ACM must be conducted by properly licensed and accredited individuals working for a licensed asbestos abatement contractor.

Should any new materials be found during renovation or demolition they should be assumed to contain asbestos until sampled and proven to be non-asbestos.

Observation Platform Shed

Asbestos-containing materials identified at the building (presented in Table 3 in Section 3.0 Results) were observed to be non-friable and in good condition. These materials should be removed if the building is to be demolished or if these materials are to be disturbed during building renovation activities. Proper federal and state regulations governing pre-alteration ACM removal must be followed. Removal of ACM must be conducted by properly licensed and accredited individuals working for a licensed asbestos abatement contractor.

Should any new materials be found during renovation or demolition they should be assumed to contain asbestos until sampled and proven to be non-asbestos.

Lead Based Paint Inspection

Laboratory Building

LBP was identified on one building component from which one lead-based paint coating was identified, as presented in Table 4 Section 3.0 Results. A total of 226 surfaces were identified as LCP. Although LBP and LCP are not required to be removed prior to building alteration, contractors working on

LBP/LCP-coated components, and/or in areas containing LBP/LCP, should be notified of its presence and must adhere to the requirements of OSHA 29 CFR1926.62. Lead hazards can be created if the paint is turned into dust by abrasion, scraping, sanding, or if fumes produced by welding or cutting are generated.

Untested building components or structures should be considered to contain regulated levels of lead until subsequent testing shows otherwise. However, the same positive test combinations of substrate, paint color, and component at one location should be assumed to contain lead at locations not specifically sampled.

Cottage

LBP was identified on one building component from which four lead-based paint coatings were identified, as presented in Table 5 Section 3.0 Results. A total of 20 surfaces were identified as LCP. Although LBP and LCP are not required to be removed prior to building alteration, contractors working on LBP/LCP-coated components and/or in areas containing LBP/LCP should be notified of its presence and must adhere to the requirements of OSHA 29 CFR1926.62. Lead hazards can be created if the paint is turned into dust by abrasion, scraping, sanding, or if fumes produced by welding or cutting are generated.

Untested building components or structures should be considered to contain regulated levels of lead until subsequent testing shows otherwise. However, the same positive test combinations of substrate, paint color, and component at one location should be assumed to contain lead at locations not specifically sampled.

Observation Platform Shed

LBP was identified on seven building components from which twelve lead-based paint coatings were identified, as presented in Table 6 Section 3.0 Results. A total of 25 surfaces were identified as LCP. Although LBP and LCP are not required to be removed prior to building alteration, contractors working on LBP/LCP-coated components and/or in areas containing LBP/LCP should be notified of its presence and must adhere to the requirements of OSHA 29 CFR1926.62. Lead hazards can be created if the paint is turned into dust by abrasion, scraping, sanding, or if fumes produced by welding or cutting are generated.

Untested building components or structures should be considered to contain regulated levels of lead until subsequent testing shows otherwise. However, the same positive test combinations of substrate, paint color, and component at one location should be assumed to contain lead at locations not specifically sampled.

Lead Based Paint Risk Assessment

Cottage

No damaged and/or deteriorated LBP was identified at the Cottage at the time of the inspection. LCP identified was in intact condition at the time of the inspection. The paint present at the building does not present a lead hazard.

Lead content of each of the dust wipe samples collected at the Cottage were within the acceptable HUD limits for the sampled building surface. As such, dust in the building does not present a lead hazard.

Although no damaged or deteriorated LBP is present and LCP was in fair condition, contractors working on LBP/LCP-coated components and/or in areas containing LBP/LCP should be notified of its presence and must adhere to the requirements of OSHA 29 CFR 1926.62 since lead hazards can be created if the paint is turned into dust by abrasion, scraping, sanding, or if fumes produced by welding or cutting are generated.

Polychlorinated Biphenyls

Laboratory Building

EA identified 118 fluorescent light ballasts without "No PCBs" labeling. Each of these ballasts is assumed to contain PCBs. These ballasts, along with any other ballasts without a "No PCBs" label, ballasts without labels, or ballasts with illegible labels that may be identified during building alteration, should be handled and disposed as indicated in 40 CFR 761.50(b)(2)(ii) and 40 CFR 761.62(a)-(c).

Cottage

EA did not identify any light ballasts assumed to contain PCBs during the inspection of the Cottage. Any ballasts without a "No PCBs" label, ballasts without labels, or ballasts with illegible labels that may be identified during building alteration, should be handled and disposed as indicated in 40 CFR 761.50(b)(2)(ii) and 40 CFR 761.62(a)-(c).

Observation Platform Shed

EA identified nine fluorescent light ballasts without "No PCBs" labeling. Each of these ballasts is assumed to contain PCBs. These ballasts, along with any other ballasts without a "No PCBs" label, ballasts without labels, or ballasts with illegible labels that may be identified during building alteration, should be handled and disposed as indicated in 40 CFR 761.50(b)(2)(ii) and 40 CFR 761.62(a)-(c).

Mercury Containing Sources and Other Environmentally Regulated Materials

Laboratory Building

EA recommends that the approximately 424 4-ft. FLTs, nine 2-ft. FLTs, four 18-in. FLTs, four 14-in. FLTs, five 12-in. circle FLTs, four 6-in circle FLTs, six mercury ampules located in thermostats be assumed to contain mercury, and that they be removed and recycled should the building be demolished or renovation work impacts these materials. Specialized waste training and licensing is not required to relocate the mercury sources. Packaging, transport, and disposal of the mercury-containing sources should be conducted in accordance with 40 CFR part 273 standards for universal waste management provided that quantities (1g mercury per package for light tubes) for management are not exceeded. The average quantity of mercury in a 4-ft. fluorescent tube is 8 mg. Should quantities for disposal exceed these limits, EPA and Department of Transportation (DOT) requirements for packaging, labelling, and transport must be followed. Care should be taken not to break the mercury-containing items, as this could release mercury to the environment and potentially expose building occupants to mercury vapor.
EA also recommends that the 30 smoke detectors, six "EXIT" signs, 12 ABC-type fire extinguishers, two 8-BC-type fire extinguishers, one Oasis water cooler, one Kelvinator refrigerator, five carrier condensers, two through-wall AC units, one approximately 1,000-gal. propane tank, and chemicals stored in the four

storage locations described in Section 3.0 Results be removed and properly disposed of should the building be demolished or renovation work impact these materials.

If any suspect mercury-containing sources or other environmentally regulated materials are found during renovation or demolition, they should be handled by appropriately licensed contractors in accordance with prevailing regulatory requirements. Waste that contains greater than 0.2 mg/L mercury when subjected to TCLP testing is considered hazardous waste.

Cottage

EA recommends that the approximately 12 4-ft. FLTs be assumed to contain mercury, and that they be removed and disposed of if they are beyond their useful life, will be disturbed should the building be demolished, or renovation work impacts these materials. Specialized waste training and licensing is not required to relocate the mercury sources. Packaging, transport, and disposal of the mercury-containing sources should be conducted in accordance with 40 CFR part 273 standards for universal waste management provided that quantities (1g mercury per package for light tubes) for management are not exceeded. The average quantity of mercury in a 4-ft. fluorescent tube is 8 mg. Should quantities for disposal exceed these limits, EPA and Department of Transportation (DOT) requirements for packaging, labelling, and transport must be followed. Care should be taken not to break the mercury-containing items, as this could release mercury to the environment and potentially expose building occupants to mercury vapor.

EA also recommends that the one smoke detector and two paint cans be removed before demolition or renovation begins.

If any suspect mercury-containing sources or other environmentally regulated materials are found during renovation or demolition, they should be handled by appropriately licensed contractors in accordance with prevailing regulatory requirements. Waste that contains greater than 0.2 mg/L mercury when subjected to TCLP testing is considered hazardous waste.

Observation Platform Shed

EA recommends that the approximately 18 4-ft. FLTs be assumed to contain mercury, and that they be removed and disposed of if they are beyond their useful life, will be disturbed should the building be demolished, or renovation work impacts these materials. Specialized waste training and licensing is not required to relocate the mercury sources. Packaging, transport, and disposal of the mercury-containing sources should be conducted in accordance with 40 CFR part 273 standards for universal waste management provided that quantities (1g mercury per package for light tubes) for management are not exceeded. The average quantity of mercury in a 4-ft. fluorescent tube is 8 mg. Should quantities for disposal exceed these limits, EPA and Department of Transportation (DOT) requirements for packaging, labelling, and transport must be followed. Care should be taken not to break the mercury-containing items, as this could release mercury to the environment and potentially expose building occupants to mercury vapor.

EA also recommends that two smoke detectors, one ABC-type fire extinguisher, one 1-pt. Minwax wood hardener, four 1-pt. DAP wallboard joint compound, one leaking 6-cell battery, 16 1-gal. paint cans, one 1-gal. assumed paint thinner, and two 10.1-oz. silicone sealant be removed before demolition or renovation begins.

If any suspect mercury-containing sources or other environmentally regulated materials are found during renovation or demolition, they should be handled by appropriately licensed contractors in accordance with prevailing regulatory requirements. Waste that contains greater than 0.2 mg/L mercury when subjected to TCLP testing is considered hazardous waste.

5.0 DISCLAIMER

EA's findings are representative of existing, observable conditions at the time of services described above. EA does not warrant that there is no ACM, LBP/LCP, PCB, mercury, or other hazardous substances in areas not inspected as part of this scope of work, nor does EA accept any liability if such is found at some future time or could have been found if additional analyses or studies were conducted.

EA does not assume responsibility for other environmental issues that may be associated with the subject facility. In view of the rapidly changing status of environmental laws, regulations, and guidelines, EA cannot be responsible for changes in laws, regulations, or guidelines that occur after the study has been completed and which may affect the facility.

This report was prepared for the National Oceanic Atmospheric Administration by EA Engineering, Science, and Technology, Inc. PBC. Any transfer of information contained in this report can be conducted only if written consent is provided by NOAA.

CONTENTS

APPENDICES

SECTION 1
INTRODUCTION

American Veteran Environmental, LLC (AVENV) was requested by **EA Engineering** to perform an Asbestos & Lead-based Paint Risk Assessment and inspection of the Fritz Peak Observatory, 3 structures belonging to the National Oceanic & Atmospheric Administration (NOAA) and located at 19126 CO State Highway 119 in Rollinsville, CO.

The Environmental Protection Agency (EPA) and Colorado Department of Public Health and Environment (CDPHE) Air Quality Control Commission requires that suspect asbestos-containing materials (ACM) be properly sampled and analyzed prior to any renovation or demolition activities. The NESHAP (National Emission Standard for Hazardous Air Pollutants) rule requires that suspect regulated asbestos-containing building materials be identified, classified and quantified prior to renovation or demolition activities. The CDPHE is responsible for administering the U.S. EPA NESHAP program for Colorado. This asbestos inspection was conducted by Colorado State Certified Asbestos Building Inspectors Sam Rolf, Certificate #921 and Paula Bowers #11051 on September 23 and 24, 2019.

1.1. SITE DESCRIPTION

The Fritz Peak Observatory consists of three (3) government buildings: T***he Fritz Peak Laboratory; Cottage; and the Observation Platform Shed (referred to in this report as the Observatory Shed)***. All three buildings are currently unoccupied. The estimated construction date for both the Fritz Peak Laboratory and the Cottage are believed to be somewhere between 1930-1940. The construction date of the Observatory Shed is unknow but assumed to be sometime after (25 years) the Laboratory Building and Cottage.

The property is located within an undeveloped mountain area of Rollinsville, Colorado bordering Colorado State Highway 119. The Cottage is located approximately 100 feet to the northeast of the Laboratory Building and the Observatory Shed is located about a tenth of a mile above the Cottage and Laboratory Building. Access to the Observatory shed is by way of steep slopes and rocky terrain.

FRITZ PEAK LABORATORY BUILDING

It is a 3-story masonry block and concrete building with yellow brick exterior with a tar and gravel roofing system and approximately 10,758 square feet. Interior walls on all three floors are a combination of concrete, wood paneling and painted drywall. The majority of the walls on the 3rd floor consist of drywall finished with wallpaper of various patterns and colors. Ceilings throughout are painted and or textured drywall. Floors are concrete and finished with various 9x9 and 12x12 floor tiles; with an area on the third floor consisting of sheet vinyl flooring.

The mechanical room / boiler room is located on the first floor. According to information provided to AVENV, the boiler (fueled by propane) was replaced approximately 20 years ago. Heating consists of baseboard heating and all visible pipes observed throughout all floors are insulated with fiberglass.

COTTAGE

The cottage is wood frame and brick construction, approximately 760 square feet with asphalt composite roofing shingles. Interior walls and ceilings are painted and textured drywall. Flooring consists of 12x12 floor tile. Heating is generated through a baseboard electrical heating system.

OBSERVATORY SHED

This structure is a metal frame with a seamed metal roof, and approximately 425 square feet. Interior consists of 2 rooms: the main room/work room; and a bunk room. Walls are finished with painted drywall; ceilings and floors are painted wood. Heating is provided by small wall mounted electrical heaters of which each have an asbestos panel behind them. There is a small free standing, wood frame storage shed located on the front /south side of the building. The remaining roofing material of the storage shed consists of green asphalt composition shingles in poor condition. No other suspect materials were observed.

SECTION 2
ASBESTOS INSPECTION

This asbestos inspection was conducted in general accordance to the *United States EPA procedures published in 40 Code of Federal Regulations (CFR) Part 763, Subpart E – Asbestos-Containing Materials in Schools and Colorado Regulation No. 8 Part B - Asbestos.* These inspection protocols specify requirements for the inspector (Section 763.85), laboratory (Section 763.87), and number of samples to be collected during an inspection (Section 763.86).

2.1. VISUAL ASSESSMENT

Inspection activities began with a visual observation of the entire structure to identify homogenous areas of suspect asbestos containing materials (ACM). A homogenous area consists of building materials, which appear similar throughout in terms of color, texture and date of application. Building materials which were not identified as concrete, glass, wood, masonry, metal or rubber are considered suspect ACM.

A physical assessment of homogenous areas of observed suspect ACM was conducted to assess the friability and condition of the materials. The EPA defines a friable material as a material, which can be crumbled, pulverized or reduced to powder by hand pressure, when dry. Friability was assessed by physically touching suspect materials. Based on the visual assessment, and the demolition plans for the building, bulk samples of suspect ACM were collected in general conformance with Asbestos Hazard Emergency Response Act (AHERA) 40 CFR763.86 protocols and as outlined in Colorado Department of Public Health and Environment (CDPHE) Regulation No. 8 Part B- Asbestos.

Samples of homogenous suspect building materials were collected in a randomly distributed manner representative of each homogenous area throughout the building. Samples were placed in sealable containers and labeled with unique sample numbers using an indelible marker.

In some circumstances a material that seems to be homogenous may yield conflicting laboratory results, in which case a return trip to identify and verify actual homogenous sampling areas may be necessary. The EPA and Colorado Department of Public Health and Environment require that a specific number of samples be collected for each homogenous area as follows:

Thermal Systems Insulation		Surfacing Materials	
Up to 1,000 Sq. Ft.	3 Samples	Up to 1,000 Sq. Ft.	3 Samples
1,000 – 5,000 Sq. Ft.	5 Samples	1,000 – 5,000 Sq. Ft.	5 Samples
More Than 5,000 Sq. Ft.	7 Samples	More Than 5,000 Sq. Ft.	7 Samples
Miscellaneous Materials: minimum of 2 each material, inspector's discretion			

2.2 REGULATORY REVIEW

The EPA and The State of Colorado (CDPHE) regulate all materials containing **greater than 1% asbestos.** OSHA regulates materials containing any quantity of asbestos, even trace amounts. Both the EPA and CDPHE requires that an asbestos inspection be conducted by an AHERA accredited Asbestos Building Inspector certified by the State of Colorado prior to renovation or demolition regardless of the date of construction. If an accredited architect or engineer responsible for the construction of the subject building provides a written statement that asbestos containing materials were not used during construction an asbestos inspection is not required.

The EPA National Emissions Standard for Hazardous Air Pollutants (NESHAP) regulation requires that ACMs be identified prior to renovation and demolition activities. NESHAP requires that no friable ACMs be disturbed during these construction activities: *removal, encapsulation, or enclosure.* The asbestos NESHAP rule (40 CFR Part 61, Subpart M) regulates asbestos fiber emissions and asbestos waste disposal practices. It also requires the identification and classification of existing building materials prior to renovation and demolition activities. Under NESHAP, asbestos containing building materials are classified as either ***Friable; Category I non-friable; or Category II non-friable ACM***.

- **Friable asbestos-containing materials** are any material containing greater than one percent asbestos and that when dry, can be crumbled, pulverized, or reduced to powder by hand pressure. Some friable materials, such as surfacing material; plaster; drywall, etc. may be in a *non-friable* state but have the potential to become friable under mechanical means such as renovation and or demolition.

- **Category I non-friable ACM** includes gaskets, packing's, resilient floor coverings, and asphalt roofing products containing greater than one percent asbestos.

- **Category II non-friable ACM** are any materials other than Category I materials that contain greater than one percent asbestos.

TRIGGER LEVELS

Trigger levels pertains to the amount of asbestos or suspect asbestos containing material that has either been disturbed or will be disturbed through renovation or demolition activities. Trigger levels are categorized by the following two (2) building types: Single Family Residential Dwelling (SFRD) and Public or Commercial Buildings. Trigger levels are what regulates an asbestos action such as an inspection; abatement (removal, encapsulation; enclosure; repair); a spill response action; and permitting.

- **Single Family Residential Dwelling** - asbestos trigger level is 32 square feet, 50 linear feet on pipes, **or the equivalence of one 55-gallon drum**.

- **Public or Commercial Bldg**. - asbestos trigger level is 160 square feet, 260 linear feet on pipes, or **the equivalence of one 55- gallon drum.**

Regulation No. 8 Part B-Asbestos requires an asbestos inspection following the AHERA protocol be conducted prior to renovation and or demolition if the activities could disturb greater than the trigger levels of any asbestos or suspect asbestos containing material.

OSHA REGULATIONS FOR ASBESTOS

The October 11, 1994, revision to the OSHA Standard requires that suspect ACM in buildings built prior to 1981 be assumed to be asbestos or an inspection be conducted by an EPA accredited asbestos building inspector.

The Occupational Safety and Health Administration (OSHA) Asbestos Standard for the Construction Industry (29 CFR 1926.1101) regulates workplace exposure to asbestos. The OSHA standard requires that employee exposure to airborne asbestos fibers be maintained below the Permissible Exposure Limit (PEL) of 0.1 fibers per cubic centimeter (0.1f/cc). Personal air monitoring may be required if the workers are expected to be exposed to asbestos in excess concentrations of the PEL. **OSHA regulations also require adequate training for all persons handling asbestos containing materials**.

The OSHA standard classifies construction and maintenance activities which could disturb ACM, and specifies training, work practices and precautions which employers must follow when engaging in each class of regulated work. States which administer their own Federally approved state OSHA programs, may require other precautions.

EPA and CDPHE policy for the handling of joint compound that has been identified as ACM, when associated with drywall that is not asbestos, results in a mixed classification which requires an evaluation of work methods to determine if the impact will be direct or indirect to determine which classification applies. The following regulatory rationale is used to determine the final classification and when the composite result may be used, and when only the layer result can be used:

1. EPA and CDPHE allows a composite sample result (drywall and joint compound together) to be used when renovation or demolition operations will only ***indirectly*** impact the joint compound, such as removal of the entire wall system (drywall and joint compound removed together), to determine if the material is ACM.

This option does not prevent classifying the material as ACM based solely on the layered result as described below.

2. When the renovation or demolition operations will ***directly*** impact the joint compound, such as sanding or scraping the joint compound, then only the layer result for the joint compound may be used to determine if the material is ACM.

OSHA does not recognize the EPA and CDPHE composite analysis policy, and therefore asbestos containing joint compound is considered ACM regardless if the activity is direct or indirect impact and is subject to applicable OSHA asbestos regulations. Removal of the drywall and joint compound together under normal demolition methods is not considered direct impact to the joint compound and is not subject to EPA and CDPHE regulations when the composite result is less than 1% asbestos.

2.3. SUSPECT ASBESTOS-CONTAINING MATERIALS

Refer to the Homogeneous Areas table in Appendix A for a complete list of suspect materials observed during this inspection.

SUSPECT SAMPLES COLLECTED

Bulk samples were collected by AVENV and submitted under chain of custody procedures to an accredited laboratory for analysis by Polarized Light Microscopy (PLM) with dispersion staining techniques per EPA methodology (40 CFR 763, Subpart F). Microscopic visual estimation was used in obtaining the percentage of asbestos in bulk samples. *Refer to Appendix B for information pertaining to the suspect materials sampled and locations as a part of this inspection.*

2.4. ASBESTOS CONTAINING MATERIALS (ACM)

Asbestos was identified in concentrations greater than one percent (>1%) in some of the materials sampled. *Refer to Appendix A Homogeneous Materials Table for materials, quantity and locations identified as a part of this inspection.*

2.5. TRACE ASBESTOS MATERIALS

Non-Friable materials containing 1% or less asbestos also referred to as "trace asbestos" are not subject to EPA and CDPHE requirements. However, CDPHE requires ***Point Count analysis*** for materials reporting trace-1% asbestos.

POINT COUNT

Point counting is a more detailed means of analysis than standard PLM. Federal and State agencies define ACM as materials containing greater than one percent (1%) asbestos. The NESHAP regulation requires that if standard PLM analysis determines that a sample contains less than ten percent (10%) asbestos, the material must be considered asbestos containing or be point counted. Even if the sample is less than one percent (1%) by standard PLM, the material must be assumed to be ACM or point counted. If the point counting analysis is different than the PLM analysis, the point counting result takes precedence.

If standard PLM analysis determines that a material has no asbestos or that the material contains greater than 10% asbestos, point counting is not necessary. Materials containing 1% or less (trace) asbestos are subject to OSHA regulations. **None of the materials sampled were point counted.**

COMPOSITE ANALYSIS

In instances where joint compound on drywall has been sampled and analyzed and determined by PLM analysis to be asbestos containing (greater than 1%), CDPHE allows for the drywall and joint compound to undergo a second method of analysis. This is recognized as "**composite"** and is used to determine the actual asbestos percentage of the compound on the entire drywall sample. If the compound is found to be less than 1% asbestos of the drywall, then the material is not classified as an asbestos containing material and therefore can be disposed of as general construction debris.

- **Composite analysis was performed on drywall samples having trace amounts of asbestos with overall resulting asbestos concentrations identified as less than one percent (<1%).**

2.5 REGULATED ASBESTOS-CONTAINING MATERIALS

Regulated asbestos-containing materials (RACMs) containing greater than 1% asbestos are required by EPA and Colorado Department of Public Health and Environment (CDPHE) regulations to be removed prior to renovation and/or demolition activities if such activities will impact these materials. RACMs are either friable materials; or non-friable materials likely to be rendered friable during the demolition and or renovation processes. Friable ACM; Category I and Category II non-friable ACM in poor condition and which has become friable or will be subject to drilling, sanding, grinding, cutting, burning, or abrading and which could be crushed or pulverized during anticipated renovation or demolition activities are considered regulated ACM (RACM) and must be removed prior to such activities. *Refer to Appendix A. Homogeneous Materials Table for asbestos containing materials, quantity and locations identified as a part of this inspection.*

SPECIAL NOTE REGARDING ROOFING & OTHER NON-FRIABLE MATERIALS

Pursuant to the Colorado Regulation 8, Control of Hazardous Air Pollutants, Section III. Part 3 Paragraph C (1) Roofing Materials: "Tar impregnated roofing felts, asphalt tiles, asphalts and mastics that are non-friable and will remain non-friable during abatement are exempt from this regulation."

The Colorado Department of Public Health and Environment, Air Pollution Control Division, allows for these materials to remain in place for demolition. However, the demolition of the building cannot include explosives; sawing (rotary or reciprocating); grinding; abrading; blasting or intentional burning that will render the materials friable. Recycling of these materials is NOT permitted.

If the non-friable ACM is to be disposed of then it must be transported to a landfill that will accept non-friable ACM. The landfill must be contacted prior to disposal to ensure that the non-friable ACM is transported and packaged in accordance with the landfill's specific policy or regulation.
If the materials have been rendered friable, the materials must be disposed of as friable asbestos-containing waste materials pursuant to subsection III.R. (Waste Handling).

SECTION 3

CONCLUSIONS AND RECOMMENDATIONS

American Veteran Environmental, LLC makes the following conclusions and recommendations based on the asbestos inspection activities and laboratory analysis of bulk samples collected:

- Asbestos containing materials were identified in bulk samples collected in all three (3) buildings. *Refer to Appendix A Homogeneous Materials Table for materials, quantity and locations identified as a part of this inspection.*

- All friable and non-friable asbestos containing materials must be removed by a certified asbestos abatement contractor (GAC) prior to renovation if such activities will impact the materials. Refer to Appendix A for material locations.

- Composite drywall with joint compound that has been composited to contain 1% or less asbestos must also be removed by a certified asbestos abatement contractor prior to renovation if the material will be impacted.

- This report is not to be used as a bidding document for the removal of asbestos containing materials. The proper removal and handling of these materials is addressed through a separate and written *"abatement scope of work"* document. This inspection report is used solely to identify and classify asbestos containing materials (ACM) and the specific locations of ACM identified.

3.1 GENERAL COMMENTS

All ACM identified in this report is subject to the EPA National Emissions Standards for Hazardous Air Pollutants (NESHAPs) Regulations for Asbestos (40 CFR Part 61) and the CDPHE Regulation No. 8 Part B-Asbestos, "The Control of Hazardous Air Pollutants". The CDPHE is responsible for administering the

U.S. EPA NESHAP program for Colorado. ACBM is subject to OSHA Construction Industry Standard for Asbestos (29 CFR Part 1926.1101). This asbestos inspection was conducted in a manner consistent with the level of care and skill ordinarily exercised by members of the profession currently practicing under similar conditions in the same locale.

The information contained in this report is relevant to the date on which this inspection was performed and should not be relied upon to represent conditions at a later date. Contractors or consultants reviewing this report must draw their own conclusions regarding further investigation deemed necessary.

AVENV does not warrant the work of regulatory agencies, laboratories or other third parties supplying information which may have been used in the preparation of this report. In the event of any reuse or publication of any portion of this report, AVENV shall not be liable for any damages arising out of such reuse or publication. Any use a third party makes of this report, or any reliance on or decisions to be made on it, is the responsibility of such third party.

3.2 FINAL COMMENTS

Reasonable effort was made by AVENV to locate and sample accessible suspect building materials associated with the project as previously detailed in this report. However, for any structure, the existence of unique or concealed asbestos-containing materials is a possibility. As per the *Asbestos Hazard Emergency Response Act* (*AHERA),* a suspect material is to be considered asbestos-containing unless it is proven otherwise by appropriate inspection and sampling.

LIMITATIONS

AVENV's level of diligence and investigative procedures are intended to reduce, but not eliminate, potential uncertainty regarding the presence of ACM. The determinations made in this report should not be construed as a guarantee that all ACM present in the subject property has been identified and included. No warranty or guarantee expressed or implied, is made regarding the findings, conclusions, or recommendations contained in this report.

Should you have any questions concerning this project, please do not hesitate to contact our office at (303) 901-9835. Thank you for the opportunity to provide this service to you.

Respectfully Submitted,

Sam Rolf

RF01	Roof flashing black/silver	1,000 SF	Exterior roof perimeter and on roof access hatch	NF-Misc. Category I	Good condition -5 Low
RT01	Tar and gravel roofing material	3,586 SF	Exterior roof of building	NF-Misc. Category I	Good condition -5 Low
SVF01	Sheet vinyl flooring tan and brown wood pattern	N/A	3rd floor	Friable- Misc.	N/A
SVW01	Sheet vinyl wall material- tan with light brown swirl pattern	N/A	wall covering in restrooms 2nd, 3rd walls of kitchen 2nd floor	Friable- Misc.	N/A
TS01	Skim texture- trowel pattern on drywall, painted	1,050 SF	2nd floor ceilings- room 2202 and adjoining hallway	Friable- Surfacing	Good condition -5 Low
TS02	Skim texture- heavy trowel pattern on drywall, painted	1,000 SF	2nd floor ceilings Room 2101	Friable- Surfacing	Good condition -5 Low
WG01	Window glaze associated with metal frame windows	N/A	Exterior windows	NF-Misc. Category II	N/A

Asbestos Containing Materials are Listed in Red.
Materials Containing 1% or less are Listed in Blue.

Friable (F): *material that be crumbled, pulverized, or reduced to powder with hand pressure when dry*
Non-Friable (NF): *material that cannot be crumbled, pulverized, or reduced to powder with hand pressure when dry*

Thermal Systems Insulation (TSI): *used to control heat transfer and or condensation on HVAC, hot and cold water or other mechanical systems etc.*

Surfacing Material (SM): *material that is sprayed or troweled onto surfaces such as fire proofing on structural members, plaster for acoustical, decorative, etc.*

Miscellaneous Material (Misc): *all other materials including taping mud, floor tile mastic, stucco, leveling compound, and hard plasters.*

Category I non-friable (NF) ACM: *resilient floor coverings, asphalt roofing products, packings, gaskets, or caulking containing greater than 1% asbestos*
Category II non-friable (NF) ACM*: any material that is not Category1 that contains greater than 1% asbestos*

Hazard Ranking:

1*= damaged or significantly damaged Thermal Systems Insulation (TSI) ACM;*
2*=damaged friable surfacing ACM;*
3*=significantly damaged friable surfacing ACM;*
4*=damaged or significantly damaged friable miscellaneous ACM;*
5*=ACBM with potential for damage;*
6*=ACBM with potential for significant damage;*
7*=any remaining friable ACBM or suspected ACBM.*

Disturbance Potential:
Low *= the material may be accessible but is not likely to be damaged under most circumstances.*

Moderate *= the material is accessible and is likely to suffer limited damage over time.*

High *= the material is friable and/or already damaged, is accessible, and there is specific reason to believe the material will receive a large amount of damage in the foreseeable future.*

Condition:
Good *= the material had no visible damage, or extremely minor damage or surface marring (i.e., a room of floor tile has only four or five with small corners broken from the tile.*

Damaged *= the material had visible damage evenly distributed over less than 10% of its surface or localized over less than 25% of its surface.*

Significantly damaged *= the material had visible damage that is evenly distributed over 10% or more of its surface or localized over 25% or more or its surface.*

Asbestos Containing Materials are Listed in Red.
Materials Containing 1% or less are Listed in Blue.

CLIENT PROJECT: 19126 CO State Hwy 119, Rollinsville, CO (Laboratory Building)
CEI LAB CODE: A1917520

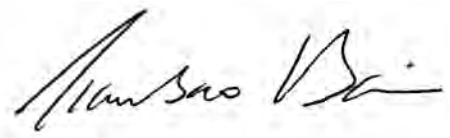
Dear Customer:

Enclosed are asbestos analysis results for PLM Bulk samples received at our laboratory on September 25, 2019. The samples were analyzed for asbestos using polarizing light microscopy (PLM) per the EPA 600 Method.

Sample results containing >1% asbestos are considered asbestos-containing materials (ACMs) per EPA regulatory requirements. The detection limit for the EPA 600 Method is <1% asbestos by weight as determined by visual estimation.

Thank you for your business and we look forward to continuing good relations.

Kind Regards,



Tianbao Bai, Ph.D., CIH
Laboratory Director

METHOD: EPA 600 / R93 / 116 and EPA 600 / M4-82 / 020

REPORTING LIMIT: <1% by visual estimation

REPORTING LIMIT FOR POINT COUNTS: 0.25% by 400 Points or 0.1% by 1,000 Points

REGULATORY LIMIT: >1% by weight

Due to the limitations of the EPA 600 method, nonfriable organically bound materials (NOBs) such as vinyl floor tiles can be difficult to analyze via polarized light microscopy (PLM). EPA recommends that all NOBs analyzed by PLM, and found not to contain asbestos, be further analyzed by Transmission Electron Microscopy (TEM). Please note that PLM analysis of dust and soil samples for asbestos is not covered under NVLAP accreditation. *Estimated measurement of uncertainty is available on request.*

This report relates only to the samples tested or analyzed and may not be reproduced, except in full, without written approval by Eurofins CEI. Eurofins CEI makes no warranty representation regarding the accuracy of client submitted information in preparing and presenting analytical results. Interpretation of the analytical results is the sole responsibility of the client. Samples were received in acceptable condition unless otherwise noted. This report may not be used by the client to claim product endorsement by NVLAP or any other agency of the U.S. Government.

Information provided by customer includes customer sample ID and sample description.

Appendix A

Homogeneous Materials Table

(Cottage)

APPENDIX A. HOMOGENEOUS MATERIALS TABLE NOAA Fritz Peak Observatory (Cottage) 19126 CO State Highway 119 Rollinsville, CO					
HA	**Description**	**Estimated Quantity**	**Locations**	**Friable Non-Friable Category**	**Hazard Ranking & Disturbance Potential**
CDW05	Composite drywall w/joint compound painted	N/A	Walls/ceilings	NF-Misc. Category II	Good Condition-Low-5
CK05	Gray caulking on metal windows	3 SF	Metal frame windows	NF-Misc. Category I	Good Condition-Low-5
FTM05	12x12 off white floor tile tan and green specs, tan mastic	N/A	Throughout interior	NF-Misc. Category I	N/A
RSG01	Asphalt composition shingle, brown spec	N/A	Exterior – roof	NF-Misc. Category I	N/A
TS03	Heavy orange peel texture on drywall	1,000 SF	Interior walls/ceilings	Friable Surfacing	Good Condition-Low-5

Friable (F): *material that be crumbled, pulverized, or reduced to powder with hand pressure when dry*
Non-Friable (NF): *material that cannot be crumbled, pulverized, or reduced to powder with hand pressure when dry*

Thermal Systems Insulation (TSI): *used to control heat transfer and or condensation on HVAC, hot and cold water or other mechanical systems etc.*

Surfacing Material (SM): *material that is sprayed or troweled onto surfaces such as fire proofing on structural members, plaster for acoustical, decorative, etc.*

Miscellaneous Material (Misc): *all other materials including taping mud, floor tile mastic, stucco, leveling compound, and hard plasters.*

Category I non-friable ACM: *resilient floor coverings, asphalt roofing products, packings, gaskets, or caulking containing greater than 1% asbestos*
Category II non-friable ACM*: any material that is not Category1 that contains greater than 1% asbestos*

Asbestos Containing Materials are Listed in Red.
Materials Containing 1% or less are Listed in Blue.

Hazard Ranking:

1*= damaged or significantly damaged Thermal Systems Insulation (TSI) ACM;*
2*=damaged friable surfacing ACM;*
3*=significantly damaged friable surfacing ACM;*
4*=damaged or significantly damaged friable miscellaneous ACM;*
5*=ACBM with potential for damage;*
6*=ACBM with potential for significant damage;*
7*=any remaining friable ACBM or suspected ACBM.*

Disturbance Potential:
Low *= the material may be accessible but is not likely to be damaged under most circumstances.*

Moderate *= the material is accessible and is likely to suffer limited damage over time.*

High *= the material is friable and/or already damaged, is accessible, and there is specific reason to believe the material will receive a large amount of damage in the foreseeable future.*

Condition:
Good *= the material had no visible damage, or extremely minor damage or surface marring (i.e., a room of floor tile has only four or five with small corners broken from the tile.*

Damaged *= the material had visible damage evenly distributed over less than 10% of its surface or localized over less than 25% of its surface.*

Significantly damaged *= the material had visible damage that is evenly distributed over 10% or more of its surface or localized over 25% or more or its surface.*

Asbestos Containing Materials are Listed in Red.
Materials Containing 1% or less are Listed in Blue.

CLIENT PROJECT: 19126 CO State Hwy 119, Rollinsville, CO (Cottage)
CEI LAB CODE: A1917520A

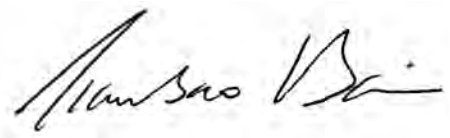
Dear Customer:

Enclosed are asbestos analysis results for PLM Bulk samples received at our laboratory on September 25, 2019. The samples were analyzed for asbestos using polarizing light microscopy (PLM) per the EPA 600 Method.

Sample results containing >1% asbestos are considered asbestos-containing materials (ACMs) per EPA regulatory requirements. The detection limit for the EPA 600 Method is <1% asbestos by weight as determined by visual estimation.

Thank you for your business and we look forward to continuing good relations.

Kind Regards,



Tianbao Bai, Ph.D., CIH
Laboratory Director

Due to the limitations of the EPA 600 method, nonfriable organically bound materials (NOBs) such as vinyl floor tiles can be difficult to analyze via polarized light microscopy (PLM). EPA recommends that all NOBs analyzed by PLM, and found not to contain asbestos, be further analyzed by Transmission Electron Microscopy (TEM). Please note that PLM analysis of dust and soil samples for asbestos is not covered under NVLAP accreditation. *Estimated measurement of uncertainty is available on request.*

APPENDIX A. HOMOGENEOUS MATERIALS TABLE NOAA Fritz Peak Observatory (Observatory Shed) 19126 CO State Highway 119 Rollinsville, CO					
HA	**Description**	**Estimated Quantity**	**Locations**	**Friable Non-Friable Category**	**Hazard Ranking & Disturbance Potential**
CB01	Cement board- Transite panels	4 panels	Interior – behind wall mounted electric heaters	NF-Misc. Category II	Good condition- Low-5
CDW06	Composite drywall w/joint compound painted	560 SF	Walls/ceiling of main room and bunk room	NF- Misc. Category II	Good condition- Low-5
CK06	Gray caulking/putty	N/A	Interior- Wall penetration on NW window	NF-Misc. Category I	N/A
CK07	White caulking, painted green	N/A	Exterior – window frames	NF-Misc. Category I	N/A
RSG02	Asphalt composition shingle green and black	5 SF- minimal remaining	Exterior- roof of storage shed ASSUMED	NF-Misc. Category I	Poor condition Low-5
WG02	White window glaze, interior metal frame windows	N/A	Interior- metal frame windows	NF-Misc. Category II	N/A

Friable (F): *material that be crumbled, pulverized, or reduced to powder with hand pressure when dry*
Non-Friable: *material that cannot be crumbled, pulverized, or reduced to powder with hand pressure when dry*

Thermal Systems Insulation (TSI): *used to control heat transfer and or condensation on HVAC, hot and cold water or other mechanical systems etc.*

Surfacing Material (SM): *material that is sprayed or troweled onto surfaces such as fire proofing on structural members, plaster for acoustical, decorative, etc.*

Miscellaneous Material (MISC): *all other materials including taping mud, floor tile mastic, stucco, leveling compound, and hard plasters.*

Category I non-friable (NF) ACM: *resilient floor coverings, asphalt roofing products, packings, gaskets, or caulking containing greater than 1% asbestos*
Category II non-friable (NF) ACM*: any material that is not Category1 that contains greater than 1% asbestos*

Asbestos Containing Materials are Listed in Red.
Materials Containing 1% or less are Listed in Blue.

Hazard Ranking:

1*= damaged or significantly damaged Thermal Systems Insulation (TSI) ACM;*
2*=damaged friable surfacing ACM;*
3*=significantly damaged friable surfacing ACM;*
4*=damaged or significantly damaged friable miscellaneous ACM;*
5*=ACBM with potential for damage;*
6*=ACBM with potential for significant damage;*
7*=any remaining friable ACBM or suspected ACBM.*

Disturbance Potential:
Low *= the material may be accessible but is not likely to be damaged under most circumstances.*

Moderate *= the material is accessible and is likely to suffer limited damage over time.*

High *= the material is friable and/or already damaged, is accessible, and there is specific reason to believe the material will receive a large amount of damage in the foreseeable future.*

Condition:
Good *= the material had no visible damage, or extremely minor damage or surface marring (i.e., a room of floor tile has only four or five with small corners broken from the tile.*

Damaged *= the material had visible damage evenly distributed over less than 10% of its surface or localized over less than 25% of its surface.*

Significantly damaged *= the material had visible damage that is evenly distributed over 10% or more of its surface or localized over 25% or more or its surface.*

Asbestos Containing Materials are Listed in Red.
Materials Containing 1% or less are Listed in Blue.

CLIENT PROJECT: 19126 CO State Hwy 119, Rollinsville, CO (Observatory Shed)
CEI LAB CODE: A1917520B

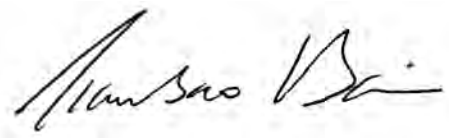
Dear Customer:

Enclosed are asbestos analysis results for PLM Bulk samples received at our laboratory on October 1, 2019. The samples were analyzed for asbestos using polarizing light microscopy (PLM) per the EPA 600 Method.

Sample results containing >1% asbestos are considered asbestos-containing materials (ACMs) per EPA regulatory requirements. The detection limit for the EPA 600 Method is <1% asbestos by weight as determined by visual estimation.

Thank you for your business and we look forward to continuing good relations.

Kind Regards,



Tianbao Bai, Ph.D., CIH
Laboratory Director

REGULATORY LIMIT: >1% by weight

Due to the limitations of the EPA 600 method, nonfriable organically bound materials (NOBs) such as vinyl floor tiles can be difficult to analyze via polarized light microscopy (PLM). EPA recommends that all NOBs analyzed by PLM, and found not to contain asbestos, be further analyzed by Transmission Electron Microscopy (TEM). Please note that PLM analysis of dust and soil samples for asbestos is not covered under NVLAP accreditation. *Estimated measurement of uncertainty is available on request.*

SECTION 4
Lead-Based Paint & Risk Assessment

LEAD-BASED PAINT RISK ASSESSMENT REPORT

For

American Veteran Environmental, LLC

Owner:
National Oceanic and Atmosphere Administration
Cottage located at:
19126 Highway 119
Rollinsville, CO 80494

Prepared By:
Burnside Enterprises, LLC
4030 Zurich Drive
Colorado Springs, CO 80920
(719) 596-4656

Colorado firm license LEF 11738

Lead-Based Paint Evaluation Date:

September 23, 2019

Report Date:

September 28, 2019

Inspector/Risk Assessor: John Burnside (CO Risk Assessor: 11876)

Risk Assessment Background Information

Burnside Enterprises, LLC, have completed a lead-based paint risk assessment at the Cottage located at 19126 Highway 119, Rollinsville, CO 80494 which was performed on September 23, 2019. The dwelling interior consists of drywall with the exterior consisting of brick with wood trim. The structure is approximately 700 square feet and was built in approximately 1950.

This risk assessment was conducted following the U.S. Department of Housing and Urban Development (HUD) *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing,* including 2012 revisions. The standard for lead-based paint, as per HUD/EPA and the State of Colorado standard for XRF measurement of $\geq$ 1.0 mg/cm^2 as being classified as positive for lead-based paint was followed. The standards for lead dust and soil hazard levels are as follows:

Dust

Floors	$\geq$ 40 µg/ft²
Window Sills	$\geq$ 250 µg/ft²
Window Troughs	$\geq$ 400 µg/ft²
Exterior Concrete	$\geq$ 800 µg/ft²

Soil

Play Area	$\geq$ 400 ppm
Driplines, Yards	$\geq$ 1,200 ppm

Risk Assessment Report Summary

A lead-based paint risk assessment was performed at Cottage located at 19126 Highway 119, Rollinsville, CO 80494, by Burnside Enterprises, LLC, (Colorado Firm Certification 11738), 4030 Zurich Drive, Colorado Springs, CO 80920. John Burnside, a Certified Risk Assessor (Colorado Certification No. 11876), conducted the risk assessment.

Results

The risk assessment of this dwelling revealed no lead-based paint hazards (as defined in the *Guidelines For the Evaluation and Control of Lead-Based Paint Hazards in Housing*, June 1995, issued by the U. S. Department of Housing and Urban Development (HUD) pursuant to Title X of the Housing and Community Development Act of 1992) exist.

Paint sampling of all painted surfaces was performed using a NITON XLp-300A portable X-ray fluorescent analyzer (XRF) to inspect all deteriorated paint surfaces at the Cottage located at 19126 Highway 119, Rollinsville, CO 80494. Current EPA and HUD guidance for paint to be less than 1.0 mg/cm² for XRF testing and 0.5% lead by weight or less than 5,000 PPM (parts per million) for Atomic Absorption Spectroscopy (AAS). Using these criteria, none of the paint surfaces listed above exceeded this limit and had deterioration. All painted surfaces were inspected for lead-based paint utilizing an XRF analyzer. All surfaces should be monitored by the owner of the dwelling to monitor the paint condition to help prevent deterioration of possible lead-based paint surfaces.

Recommendations

There are several different measures that can be implemented to help reduce the possibility of lead-based paint hazards at the dwelling. These can be divided into two (2) primary categories: Interim Controls and Abatement.

The HUD definition of abatement can be described as a set of measures which makes the lead-based paint surface inaccessible to dwelling occupants for a minimum of twenty (20) years. Please note that this does not mean that the lead-based paint has to be completely removed; it can be controlled by enclosure or encapsulation systems which provide a dust tight enclosure or encapsulation with twenty (20) year minimum duration.

Interim Controls would be all tasks which have up to a twenty (20) year duration. Interim controls are considered more of a temporary fix but with periodic monitoring and reevaluation of the lead-based paint surface, interim controls can help to reduce the possibility of lead-based paint hazards quite effectively. Interim controls can include such items as painting, cleaning, owner/occupant education of lead-based paint hazards, installation of sod or other ground cover, etc.

Based upon the fact that no lead hazards found at the dwelling, **no recommended interim control options are required to be implemented at the dwelling.**

A copy of this summary must be provided to new lessees (tenants) and purchasers of this property under Federal law (24 CFR part 35 and 40 CFR part 745) before they become obligated under a lease or sales contract. The complete report must also be provided to new purchasers and it must be made available to new tenants. Landlords (lessors) and sellers are also required to distribute an educational pamphlet approved by the U. S. Environmental Protection Agency and include standard warning language in their leases or sales contracts to ensure that parents have the information they need to protect their children from lead-based paint hazards.

This report is submitted by Burnside Enterprises, LLC and includes a visual survey and X-Ray Fluorescence (XRF) analysis of the readily accessible painted and stained components in the surveyed area. The intent of this report is to identify if lead-based paint is present in the surveyed area, and if so, what components are affected. The presence or absence of lead-based paint or lead-based paint hazards applies only to the tested or assessed surfaces on the date of the field visit and it should be understood that conditions noted within this report were accurate at the time of the inspection and in no way reflect the conditions at the property after the date of the inspection.

Burnside Enterprises, LLC, makes no warranty, guarantee, or representation, expressed or implied, with respect to the effectiveness of any construction methods or activities regarding the containment and/or removal of lead-based paint. Our liability (Burnside Enterprises, LLC) is limited to the component surfaces that we are authorized to test using equipment, methods and procedures as set forth in the current acceptable industry guidelines, Housing and Urban Development (HUD) Guidelines Chapter 7 (revised 2012) and Colorado regulation No. 19. Burnside Enterprises, LLC assumes no responsibility for any injury to individuals or property, or for any financial loss, sustained as a result of the incorrect use or application of this report.

This report must be considered solely as a resource document representing a consensus of opinion. It is intended that this document serve as a guideline for owners or others in development of plans and activities that may be required in dealing with lead-based paint surfaces that may exist on the property. It is not the purpose or burden of this document to provide all embracing answers to every problem of lead paint. Users bear all risks associated with reliance on these results and shall have the sole responsibility to evaluate the information contained herein and to form their own independent judgments on the use of this information as may be appropriate to specific circumstances or actions.

The report also does not include evaluation of water, materials not visible (behind wall, ceiling, or floor surfaces), or adjacent property for the presence of lead hazards. Any other environmental hazards that may be found at this property are outside the scope of this report.

The paint inspection report is for the exclusive private use of NOAA and American Veteran Environmental, LLC and the professional services of Burnside Enterprises, LLC. and undertaken for and performed in the interest of NOAA and American Veteran Environmental, LLC. No contractual obligation is assumed for the benefit of any other person or company involved with this dwelling. This report is confidential and is not to be copied or disseminated to any other party without the expressed written consent of Burnside Enterprises, LLC. Use of or reliance upon the report by other parties or for other transactions is strictly prohibited.

A copy of this summary must be provided to new lessees (tenants) and purchasers of this property under Federal law (24 CFR part 35 and 40 CFR part 745) before they become obligated under a lease or sales contract. The complete report must also be provided to new purchasers and it must be made available to new tenants. Landlords (lessors) and sellers are also required to distribute an educational pamphlet approved by the U. S. Environmental Protection Agency and include standard warning language in their leases or sales contracts to ensure that parents have the information they need to protect their children from lead-based paint hazards.

The information that follows in this report are the testing results and inspector certification that comprise the basis of this report.

Resident Questionnaire

Children/Children's Habits

1. (a) Do you have any children that live in your home? Yes _____ No __X___
   (b) If yes, how many? Ages?
   (c) Record blood levels, if known
   (d) IF NO CHILDREN, SKIP TO Question 5

1. Locate the rooms/areas where each child sleeps, eats, and plays:

Name of Child	Location of Bedroom	Location of All Rooms Where Child Sleeps	Primary Location Where Child Plays Indoors	Primary Location Where Child Plays Outdoors

3. Where are toys stored/kept?
4. Is there any visible evidence of chewed or peeling paint on the woodwork, furniture, or toys? Yes/No

Family Use Patterns

5. Which entrances are used most frequently? Side A
6. Which windows are opened most frequently? All
7. Do you use window air conditioners? If yes, where? No
   (Condensation often causes paint deterioration)
8. (a) Do any household members engage in gardening? No
   (b) Record the location of any vegetable garden.
   (c) Are you planning any landscaping activities that will remove grass or ground covering? No
9. (a) How often is the household cleaned? Infrequently
   (b) What cleaning methods do you use?
10. (a) Did you recently complete any building renovations? No
    (b) If yes, where?
    (c) Was building debris stored in the yard? No If yes, where?
11. Are you planning any building renovations? Where? No
12. (a) Do any household members work in a lead-related industry? No
    (b) If yes, where are dirty clothes placed and cleaned?

Building Condition Form

Condition	Yes	No
Roof missing parts of surfaces (tiles, boards, shakes, etc.)		X
Roof has holes or large cracks		X
Gutters or downspouts broken		X
Chimney masonry cracked, bricks loose or missing, obviously out of plumb		X
Exterior or interior walls have obvious large cracks or holes, requiring more than routine pointing (if masonry) or painting		X
Exterior siding has missing boards or shingles		X
Water stains on interior walls or ceilings		X
Plaster walls or ceilings deteriorated		X
Two or more windows or doors broken, missing, or boarded up		X
Porch or steps have major elements broken, missing, or boarded up		X
Foundation has major cracks, missing material, structure leans, or visibly unsound		X
* Total Number	0	11

* If the "Yes" column has two or more checks, the dwelling is usually considered to be in poor condition for the purposes of a risk assessment. However, specific conditions and extenuating circumstances should be considered before determining the final condition of the dwelling and the appropriateness of a lead hazard screen.

Notes:

Paint Conditions on Selected Surfaces

(Single-Family, Owner-Occupied)

Building Component	Location Notes	Paint condition (intact, fair, poor, or not present) to be completed by Risk Assessor	Deterioration due to friction or impact?	Deterioration due to moisture?	Location of painted component with visible bite marks
Building siding		Intact			
Exterior trim-soffits		Intact			
Exterior windows (trim)		Intact			
Exterior doors - threshold		Intact			
Interior doors - jamb		Intact			
Ceilings		Intact			
Walls		Intact			
Interior windows		Intact			
Interior floors		Intact			
Interior trim		Intact			
Bathroom cabinets		Intact			

If the overall condition of a component is similar throughout a dwelling, that condition should be recorded. If a component in a couple of locations is in poor condition, but the overall condition is good or fair, the specific sites of the badly deteriorated paint should be noted. The specific locations of any component with bite marks should be recorded.

Field Sampling Form for Dust
(Single-Surface Sampling)

Name of Risk Assessor John Burnside Lab. ID# 157245
Name of property owner : American Veteran Environmental, LLC
Property address : Cottage located at 19126 Highway 119, Rollinsville, CO 80494
Dwelling selection protocol X All dwellings ___Targeted ___Worst case ___Random

Target dwelling criteria (check all that apply)

_____ Code violations
_____ Judged to be in poor condition
_____ Presence of two or more children between ages of 6 months and 6 years
_____ Serves as day-care facility
_____ Recently prepared for re-occupancy

Sample number	Room (record name of room used by the owner or resident)	Surface type	Is surface smooth and cleanable?	Dimensions* of sample area (inches × inches)	Area (ft^2)	Result of lab analysis ($\mu g/ft^2$)

Lead-Based Paint Inspection Report

For

American Veteran Environmental, LLC

For the Building Located at:
Fritz Peak Observatory
19126 Highway 119
Rollinsville, CO 80494

Performed By

John C. Burnside
Certified Lead-Based Paint Inspector/Risk Assessor
Colorado Certification 11876

Burnside Enterprises, LLC
4030 Zurich Drive
Colorado Springs, CO 80920
(719)-596-4656

Colorado Firm License LEF #11738

September 23, 2019

Inspection Background Information

Burnside Enterprises, LLC has completed a lead-based paint inspection at Fritz Peak Observatory, 19126 Highway 119, Rollinsville, CO 80494, which was performed on September 23, 2019. The building is a three-story structure constructed of brick and interior consists of drywall. The structure was constructed in approximately 1940. A metal observatory platform shack (OPS) is also located on the property.

John Burnside, a Colorado certified inspector/risk assessor (Certification No. 11876) performed the inspection.

This inspection was conducted following the U.S. Department of Housing and Urban Development (HUD) *Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing,* 2012 revisions. The standard for lead-based paint, as per HUD/EPA and the State of Colorado standard for XRF measurement of ≥ 1.0 mg/cm^2 as being classified as positive for lead-based paint was followed. All requirements for the NITON XRF contained in the Performance Characteristics Sheet for the NITON XLp-300 were followed.

The painted surfaces in the rooms are identified as components, which can generally be defined as architectural features of the building. Components consist of walls, ceilings, floors, doors, door jambs, window sashes, windowsills, stair treads, etc. These are the visible parts of the building. Painted and/or stained components are tested. Each component may be represented many times in a single room. For example, there are generally baseboards on all walls in a room. It is not necessary to test each of these baseboards in the room as long as they appear to have the same paint history. Components covered with vinyl and/or metal siding are not inspected (as these surfaces below these components are not visible or accessible for this inspection. This does leave the possibility that lead-based painted components could be located beneath these coverings). All components within a room are tested a minimum of once with the exception of walls for which all four wall sides within a room will be tested. The A side would refer to the address side wall of the building with the B, C, and D designations referring to the remaining walls and/or components in a clockwise rotation.

Testing was performed using a NITON XLp-300 X-Ray Fluorescence Spectrometer (XRF), serial number 94979.

Executive Summary

A surface by surface investigation for lead-based paint was performed at Fritz Peak Observatory, 19126 Highway 119, Rollinsville, CO 80494, on September 23, 2019 by John Burnside of Burnside Enterprises, LLC (Colorado Certification 11738), 4030 Zurich Drive, Colorado Springs, CO 80920. Testing was performed using a NITON XLp-300 X-Ray Fluorescence Spectrometer (XRF), serial number 94979. The inspection indicated that based upon the current HUD guideline levels, **the following areas were found to contain lead-based paint above or equal to 1.0 mg/cm²:**

No	Site	Room	Side	Structure	Feature	Substrate	Color	Condition	Results	PbC	Units
393	Lab Bldg	Exterior	C	Porch	Ceiling	Wood	Grey	Poor	Positive	1.3	mg/cm²
409	OPS	Exterior	A	Wall		Metal	Green	Fair	Positive	1.3	mg/cm²
410	OPS	Exterior	A	Door		Metal	Green	Fair	Positive	1.4	mg/cm²
411	OPS	Exterior	A	Window	Sash	Metal	Green	Fair	Positive	1.4	mg/cm²
412	OPS	Exterior	B	Wall		Metal	Green	Fair	Positive	1.2	mg/cm²
414	OPS	Exterior	C	Window	Sash	Metal	Green	Fair	Positive	1.5	mg/cm²
416	OPS	Exterior	D	Wall		Metal	Green	Fair	Positive	1.7	mg/cm²
457	OPS	Outhouse Ext	A	Wall	Soffit	Wood	Green	Poor	Positive	1.3	mg/cm²
463	OPS	Outhouse Ext	D	Wall		Wood	Green	Poor	Positive	1.2	mg/cm²
464	OPS	Outhouse Ext	D	Wall	Soffit	Wood	Green	Poor	Positive	1.4	mg/cm²
430	OPS	Rm. 01	D	Floor		Wood	Grey	Intact	Positive	1.5	mg/cm²
434	OPS	Rm. 02	A	Floor		Wood	Grey	Intact	Positive	1.1	mg/cm²
448	OPS	Shed Ext	C	Door		Wood	Green	Poor	Positive	1.3	mg/cm²

A copy of this summary must be provided to new lessees (tenants) and purchasers of this property under Federal law (24 CFR part 35 and 40 CFR part 745) before they become obligated under a lease or sales contract. The complete report must also be provided to new purchasers and it must be made available to new tenants. Landlords (lessors) and sellers are also required to distribute an educational pamphlet approved by the U. S. Environmental Protection Agency and include standard warning language in their leases or sales contracts to ensure that parents have the information they need to protect their children from lead-based paint hazards.

This report is submitted by Burnside Enterprises, LLC and includes a visual survey and X-Ray Fluorescence (XRF) analysis of the readily accessible painted and stained components in the surveyed area. The intent of this report is to identify if lead-based paint is present in the surveyed area, and if so, what components are affected. The presence or absence of lead-based paint or lead-based paint hazards applies only to the tested or assessed surfaces on the date of the field visit and it should be understood that conditions noted within this report were accurate at the time of the inspection and in no way reflect the conditions at the property after the date of the inspection.

Burnside Enterprises, LLC, makes no warranty, guarantee, or representation, expressed or implied, with respect to the effectiveness of any construction methods or activities regarding the containment and/or removal of lead-based paint. Our liability (Burnside Enterprises, LLC) is limited to the component surfaces that we are authorized to test using equipment, methods and procedures as set forth in the current acceptable industry guidelines, Housing and Urban Development (HUD) Guidelines Chapter 7 (revised 2012) and Colorado regulation No. 19. Burnside Enterprises, LLC assumes no responsibility for any injury to individuals or property, or for any financial loss, sustained as a result of the incorrect use or application of this report.

This report must be considered solely as a resource document representing a consensus of opinion. It is intended that this document serve as a guideline for owners or others in development of plans and activities that may be required in dealing with lead-based paint surfaces that may exist on the property. It is not the purpose or burden of this document to provide all embracing answers to every problem of lead paint. Users bear all risks associated with reliance on these results and shall have the sole responsibility to evaluate the information contained herein and to form their own independent judgments on the use of this information as may be appropriate to specific circumstances or actions.

The report also does not include evaluation of water, materials not visible (behind wall, ceiling, or floor surfaces), or adjacent property for the presence of lead hazards. Any other environmental hazards that may be found at this property are outside the scope of this report.

The paint inspection report is for the exclusive private use of American Veteran Environmental, LLC and the professional services of Burnside Enterprises, LLC and undertaken for and performed in the interest of American Veteran Environmental, LLC. No contractual obligation is assumed for the benefit of any other person or company involved with this building. Use of or reliance upon the report by other parties or for other transactions is strictly prohibited unless required by law (i.e. tenant disclosure, real estate transaction).

A copy of this summary must be provided to new lessees (tenants) and purchasers of this property under Federal law (24 CFR part 35 and 40 CFR part 745) before they become obligated under a lease or sales contract. The complete report must also be provided to new purchasers and it must be made available to new tenants. Landlords (lessors) and sellers are also required to distribute an educational pamphlet approved by the U. S. Environmental Protection Agency and include standard warning language in their

leases or sales contracts to ensure that parents have the information they need to protect their children from lead-based paint hazards.

The information that follows in this report are the testing results and inspector certification that comprise the basis of this report.

Test Report: Lead in Dust by Flame AAS (SW 846 3050B/7000B)*

Client Sample Description	Lab ID	Collected	Analyzed	Area Sampled	Lead Concentration
W01	*201910235-0001*	9/23/2019	9/25/2019	1 ft²	13 µg/ft²
	Site: Rm 1 Living - Floor				
W02	*201910235-0002*	9/23/2019	9/25/2019	1.13 ft²	13 µg/ft²
	Site: Rm 1 Living - Sill				
W03	*201910235-0003*	9/23/2019	9/25/2019	1 ft²	12 µg/ft²
	Site: Rm 2 Bedroom - Floor				
W04	*201910235-0004*	9/23/2019	9/25/2019	0.66 ft²	<15 µg/ft²
	Site: Rm 2 Bedroom - Sill				
W05	*201910235-0005*	9/23/2019	9/25/2019	1 ft²	11 µg/ft²
	Site: Rm 4 Bedroom - Floor				
W06	*201910235-0006*	9/23/2019	9/25/2019	0.66 ft²	<15 µg/ft²
	Site: Rm 4 Bedroom - Sill				
W07	*201910235-0007*	9/23/2019	9/25/2019	1 ft²	<10 µg/ft²
	Site: Rm 5 Hall - Floor

*Analysis following Lead in Dust by EMSL SOP/ Determination of Environmental Lead by FLAA. Reporting limit is 10 µg/wipe. ug/wipe =µg/ft² x area sampled in ft². Unless noted, results in this report are not blank corrected. This report relates only to the samples reported above and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities (such as volume sampled) or analytical method limitations. Samples received in good condition unless otherwise noted. The lab is not responsible for data reported in µg/ft² which is dependent on the area provided by non-lab personnel. The test results contained within this report meet the requirements of NELAC unless otherwise noted. "<" (less than) results signifies that the analyte was not detected at or above the reporting limit. Measurement of uncertainty is available upon request. The QC data associated with the sample results included in this report meet the recovery and precision requirements unless specifically indicated otherwise. Definitions of modifications are available upon request.

Samples analyzed by EMSL Analytical, Inc. Cinnaminson, NJ NELAP Certifications: NJ 03036, NY 10872, PA 68-00367, AIHA-LAP, LLC ELLAP 100194, A2LA 2845.01
